SOLANO LANDING PROJECT

TRAFFIC IMPACT ANALYSIS

EXECUTIVE SUMMARY

Project Description. This study evaluates the traffic impacts associated with the proposed Solano Landing project in Solano County. The project is located in the southeast quadrant of the Suisun Valley Road / Rockville Road intersection, north and west of the City of Fairfield and about 1½ miles north of Interstate 80 (I-80). This area is the County's Agriculture Tourist Center (ATC) Zone and includes the following development:

- 6 - 1,500 square foot wine tasting rooms
- Multi-purpose room / event center to accommodate 100 persons for wine tasting event
- 10-room boutique hotel
- 7,600 square foot fine dining restaurant
- 5,500 square foot specialty supermarket

The project is expected to generate 289 trips in the Friday p.m. peak period and 384 trips in the Saturday peak hour. Due to the ability for a wine tasting room to have a special event two scenarios were evaluated on Saturday, a special event occurring with event traffic inbound and a special event occurring with event traffic departing; the Friday p.m. peak hour assessment assumed that special event traffic was only headed inbound. After considering internal trips and pass-by trips the project is projected to generate 211 new Friday p.m. peak hour trips, 293 new Saturday trips with inbound special event traffic and 289 new Saturday trips with outbound special event traffic.

Existing Setting. Levels of Service were evaluated at nine existing intersections. The study included an analysis of the Friday p.m. peak hour and the Saturday peak hour. County Level of Service policy considers LOS C as the acceptable threshold while the City of Fairfield and Caltrans consider LOS D as the acceptable threshold.

All intersections currently operate within agency thresholds, within LOS C conditions at Solano County intersections and LOS D conditions at City of Fairfield and Caltrans agency intersections. While operating at an acceptable level of service the Suisun Valley Road / Neitzell Road intersection meet the peak hour signal warrant.

Significant Transportation Effects for Existing plus Project Conditions

Under Existing plus Project conditions, all intersections will continue to operate within acceptable levels of service. The Suisun Valley Road / Neitzell Road intersection will continue to operate at an acceptable level of service and meet the peak hour signal warrant.

The following recommendations are noted:

- The project should pay their fair share traffic impact fees in Solano County.
- The County should consider extending the 25-mph speed zone along Rockville Road to east of the project driveway as the site will be within the Rockville community. Shifting the zone to at least 150 feet east of the driveway will provide westbound motorists time to decelerate from 45 mph to 25 mph prior to reaching the driveway.
- The County should consider extending the 25-mph speed zone along Suisun Valley Road at least 100 feet south of the existing speed limit sign location. This will provide northbound motorists time to decelerate to 25-mph prior to reaching the intersection.

2040 Conditions

Under 2040 conditions all intersections are projected to operate within agency thresholds, within LOS C conditions at Solano County intersections and LOS D conditions at City of Fairfield and Caltrans agency intersections. The Suisun Valley Road / Neitzell Road intersection will operate at LOS D or better and meet the peak hour signal warrant.

Significant Transportation Effects for 2040 Plus Project Conditions

Under 2040 plus Project conditions, all intersections will continue to operate within acceptable levels of service. The Suisun Valley Road / Neitzell Road intersection will continue to operate at an acceptable level of service and meet the peak hour signal warrant.

SOLANO LANDING PROJECT TRAFFIC IMPACT ANALYSIS

INTRODUCTION

Study Purpose and Objectives

This study evaluates the traffic impacts associated with the proposed Solano Landing project in Solano County. The project is located in the southeast quadrant of the Suisun Valley Road / Rockville Road intersection, north and west of the City of Fairfield and about 1½ miles north of Interstate 80 (I-80), as shown in Figure 1. The project is within the County's Agriculture Tourist Center (ATC) Zone and includes the following development:

- 6 - 1,500 square foot wine tasting rooms
- Multi-purpose room / event center to accommodate 100 persons for wine tasting event
- 10- room boutique hotel
- 7,600 square foot fine dining restaurant
- 5,500 square foot specialty supermarket

The proposed site plan is shown in Figure 2. Access to the site will be via the existing Suisun Valley Road / Suisun Valley Court intersection and a new driveway along Rockville Road.

The study parameters are consistent with Solano County guidelines. The study addresses the following traffic scenarios:

1. Existing (2021) Peak Hour Traffic Conditions;
2. Existing plus Project Peak Hour Traffic Conditions;
3. Year 2040 Peak Hour Traffic Conditions;
4. Year 2040 plus Project Peak Hour Traffic Conditions;

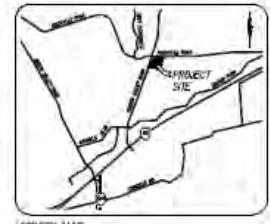

The purpose of this analysis is to identify the potential traffic-related impacts of the project within the context of current traffic conditions and to evaluate the cumulative impacts of future traffic conditions in the Solano County / City of Fairfield area. As the site is geared primarily to tourist destinations this analysis includes evaluation of existing circulation conditions based upon current Friday p.m. and Saturday peak hour traffic volumes. The extent to which improvements may already be needed to meet minimum standards was determined. The characteristics of the proposed project were determined based on probable peak hour, regional trip distribution and local trip assignment. Forecasts of future year traffic conditions, including other development anticipated under the Solano County General Plan have been analyzed with and without the proposed project using the latest Solano Transportation Authority travel demand model. Mitigation measures needed to ensure satisfactory operation of area intersections under each development scenario are identified.

In addition to analyzing roadway conditions for consistency with the County's General Plan Vehicle Miles Travelled (VMT) was also considered, consistent with the County's 2021 Interim Modifications guidelines.

SITE PLAN

EXISTING SETTING

Study Area

This study addresses traffic conditions in the vicinity of the Solano Landing project site, including the project routes from the I-80 / Suisun Valley Road and I-80 / I-680-Green Valley Road interchanges. Based on direction from Solano County staff nine intersections along the routes providing access to the site and the two access intersections were analyzed. The text that follows describes the facilities included in this analysis.

Study Area Intersections

The quality of traffic flow is typically governed by the operation of major intersections. Nine intersections serving this site were identified for evaluation. These include:

- 1) Suisun Valley Road / Rockville Road
- 2) Rockville Road / Abernathy Road
- 3) Suisun Valley Road / Solano College Road (south)
- 4) Suisun Valley Road / Westamerica Road
- 5) Suisun Valley Road / Business Center Drive
- 6) Suisun Valley Road / Neitzell
- 7) Pitman Road / I-80 Eastbound Ramps
- 8) Green Valley Road / Business Center Drive
- 9) Green Valley Road / I-80 Westbound On-Ramp

P.m. Friday and Saturday mid-day peak hour counts were conducted at each of these intersections in early December, 2021. The Saturday mid-day peak two-hour period was determined using analytic data from *StreetLight Data*. Intersection turning movements were then counted for this two-hour period, and the peak hour determined. Volume adjustments were made based on 2019 *StreetLight* data and the December 2021 counts to arrive at pre-Covid volumes. Each study intersection is described below:

Suisun Valley Road / Rockville Road is a signalized four-way intersection in the northwest quadrant of the project site. The eastbound approach includes a left turn lane, a through lane and a right turn lane while the westbound approach includes a left turn lane, a through lane and a right turn lane. The right turn lane appears to have originally been designed as a free right turn; however, this lane is now stop controlled north of the signal. The northbound approach includes a shared left-through lane and a right turn lane while the southbound approach is a single shared left-through-right lane. The east-west approaches include protected left turn movements while the north-south approaches are split phased. Crosswalks are present along the west and north approaches with sidewalk only in the northwest quadrant. Bike lanes are not present.

Rockville Road / Abernathy Road is a single lane four-way roundabout four-way intersection about 1 $\frac{3}{4}$ miles east of the project site. Bike lanes are present on the east leg of the intersection. Sidewalks are not present.

The **Suisun Valley Road / Solano College Road-Oakwood Drive** is a signalized four-way intersection south of the project site. The northbound approach includes a left turn lane, two through lanes and a single lane “ramp” that transitions to a two-lane stop approach along Solano College Road east of the intersection. The southbound approach includes a left turn lane, a through lane and a shared through-right lane. The eastbound approach along Oakwood Drive includes a shared left-through lane and a right turn lane. The westbound approach includes a left turn lane, a shared left-through lane and a free right turn with yield onto northbound Suisun Valley Road. Suisun Valley Road provides protected left turn movements while the Oakwood Drive and Solano College Road approaches are split phase. Crosswalks are present along the west, north and east approaches with sidewalk and pathways present along Oakwood Drive and Solano College Road and Suisun Valley Road south of the intersection. Bike lanes are present on Suisun Valley Road south of the intersection.

The **Suisun Valley Road / Westamerica Drive-Kaiser Drive** is a signalized four-way intersection south of the project site. The northbound approach includes a left turn lane, two through lanes and a shared through-right lane. The southbound approach includes a left turn lane, two through lanes and a right turn lane. The eastbound approach along Westamerica Drive includes a left turn lane and a shared through-right turn lane while the westbound approach includes a left turn lane, a through lane and a shared through-right lane. Protected left turn movements are provided on all approaches. Crosswalks are present along all approaches. Bike lanes are present on Suisun Valley Road while bike sharrows are present along Westamerica Drive.

The **Suisun Valley Road / Business Center Drive** is a signalized four-way intersection south of the project site. The northbound approach includes dual left turn lanes, a through lane and a shared through-right lane. The southbound approach includes dual left turn lanes, two through lanes and a right turn lane. Both eastbound and westbound approaches along Business Center Drive include dual left turn lanes, two through lanes and a shared through-right lane. Protected left turn movements are provided on all approaches and crosswalks are present along all approaches. Bike lanes are present throughout the intersection except along the northbound Suisun Valley Road approach.

Suisun Valley Road / Neitzell Road is an all-way stop controlled tee intersection. Northbound Suisun Valley Road includes a left turn lane and two through lanes while the southbound approach includes two through lanes and a free right turn lane about 200 feet in advance of the intersection. Neitzell Road includes two left turn lanes and a free right turn lane with yield onto southbound Suisun Valley Road. Bike lanes and crosswalks are not present in the intersection.

I-80 Eastbound Ramps / Pitman Road is a signalized intersection in a Type L-2 configuration. The southbound Pitman Road approach consists of dual left turn lanes and a through lane while the northbound approach includes a through lane and a right turn lane. The eastbound I-80 off-ramp includes a shared left-through lane and a right turn lane. The on-ramp includes two general purpose lanes.

The **Green Valley Road / Business Center Drive** is a signalized four-way intersection southwest of the project site. The northbound Green Valley Road approach includes dual left turn lanes, two through lanes and a right turn lane. The southbound approach includes a left turn lane, a through lane and a shared through-right turn lane. The eastbound approach along Business Center Drive

includes a left turn lane, a shared left-through lane and dual right turn lanes. The westbound approach includes a left turn lane, a shared left-through lane and a shared through-right lane. Protected left turn movements are provided along Green Valley Road while split phasing is used on Business Center Drive. The right turn eastbound Business Center Drive lanes are also overlapped with the northbound Green Valley Road left turn lanes. Crosswalks are present along each approach and bike lanes are present throughout the intersection.

The **Green Valley Road / I-80 Westbound On-Ramp intersection** is a signalized tee intersection providing access to westbound I-80. The northbound Green Valley Drive approach consists of dual left turn lanes and a through lane while the southbound approach includes a through lane and a right turn lane. The westbound I-80 on-ramp includes two general purpose lanes.

The **Suisun Valley Road / Suisun Valley Court intersection** is an unsignalized tee intersection with stop control along Suisun Valley Court; an opposing private driveway is present opposite Suisun Valley Court. All approaches are single lane.

Analysis Criteria

Vehicle Miles Traveled. The impact of a project on LOS is an important factor in determining whether a project has a significant impact. However, changes made in 2018 to CEQA have changed how lead agencies use LOS in determining whether a project has a significant impact on transportation. As noted in the California Governor's Office of Planning and Research (OPR) document Technical Advisory on Evaluating Transportation Impacts in CEQA (California Governor's Office of Planning and Research 2018),

“Senate Bill 743 (Steinberg, 2013), which was codified in Public Resources Code section 21099, required changes to the guidelines implementing CEQA (CEQA Guidelines) (Cal. Code Regs., Title 14, Div. 6, Ch. 3, § 15000 et seq.) regarding the analysis of transportation impacts... OPR has proposed, and the California Natural Resources Agency (Agency) has certified and adopted, changes to the CEQA Guidelines that identify vehicle miles traveled (VMT) as the most appropriate metric to evaluate a project’s transportation impacts. With the California Natural Resources Agency’s certification and adoption of the changes to the CEQA Guidelines, automobile delay, as measured by “level of service” and other similar metrics, generally no longer constitutes a significant environmental effect under CEQA. (Pub. Resources Code, § 21099, subd. (b)(3).)”

Certain types of projects as identified in statute, the CEQA Guidelines, or in OPR’s Technical Advisory are presumed to have a less than significant impact on VMT and therefore a less than significant impact on transportation. Generally, the identified projects contribute to efficient land use patterns enabling higher levels of walking, cycling, and transit as well as lower average trip length. These projects include, for example, projects in transit priority areas, projects consisting of residential infill or those located in low VMT areas.

The County identifies projects and areas presumed to have a less than significant transportation impact. Those include:

1. A Use Permit or other discretionary development which generates 110 total vehicle trips per day or less (770 total vehicle trips per week or less) will have less than significant impact on VMT. Employee trips are not considered in the total vehicle trip generation due to the reduction in regional commute trips and VMT due to local job creation.
2. An agricultural development that facilitates farm products primarily to local ag processing centers, cities and markets in Solano County will have less than significant impact on VMT.
3. A development that is within a $\frac{1}{2}$ mile of an active transit stop with reasonable transportation connections qualifies for less than significant impact on VMT.
4. A development that is adjacent to a fully developed and connected system of bike lanes qualifies for less than significant impact on VMT for up to 125 total vehicle trips per day or less (875 total vehicle trips per week or less).
5. Permitted special events that include advertisements for and coordinated assistance with carpool and / or transit options for attendees.

General Plan Policy Consistency Level of Service Analysis Methodology. To assess the quality of existing traffic conditions and provide a basis for analyzing project impacts, Levels of Service were calculated at study area intersections and project driveways. "Level of Service" is a qualitative measure of traffic operating conditions whereby a letter grade "A" through "F", corresponding to progressively worsening operating conditions, is assigned to an intersection or roadway segment.

The analysis techniques presented in the *Highway Capacity Manual 6th Edition* were used to provide a basis for describing existing traffic conditions and evaluating the significance of project traffic impacts.

Various software programs have been developed to assist in calculating intersection Level of Service, and the level of sophistication of each program responds to factors that affect the overall flow of traffic. Two programs, Synchro and SIDRA were utilized for the analysis depending on the intersection characteristics. Synchro is generally used to analyze signalized and stop controlled intersections while SIDRA is used to analyze roundabouts. Synchro Version 11 and SIDRA Version 9 were used for the analysis.

The Level of Service (LOS) policies of Solano County, City of Fairfield and Caltrans govern this analysis. The Solano County Road Standards documents the County's policies for Level of Service in rural and urban areas. The document notes that LOS C is the design standard for the County; however, if an existing LOS is already below LOS C a project shall be designed such that there will be no decrease in the existing LOS.

The City of Fairfield LOS threshold standards apply to the p.m. peak hour. LOS D is the standard for arterial streets while LOS C is the standard for collector streets and LOS B applies to local streets.

Caltrans *Vehicle Miles Traveled-Focused Transportation Impact Study Guide, 2020* notes that Vehicle Miles Traveled (VMT) analysis is now Caltrans' primary focus under CEQA. However, the prior Caltrans publication *Guide for the Preparation of Traffic Impact Studies* (dated December 2002) states the following: "Caltrans endeavors to maintain a target LOS at the transition between

LOS "C" and LOS "D" on State highway facilities, however, Caltrans acknowledges that this may not be always feasible and recommends that the lead agency consult with Caltrans to determine the appropriate target LOS".

Therefore, for this analysis, LOS C and better are considered acceptable at Solano County maintained intersections while LOS D worse is considered acceptable at City of Fairfield and Caltrans intersections.

Table 1 presents general characteristics associated with each Level of Service grade.

**TABLE 1
LEVEL OF SERVICE DEFINITIONS**

Level of Service	Signalized Intersection	Unsignalized Intersection	Roadway (Daily)
"A"	Uncongested operations, all queues clear in a single-signal cycle. Ave Delay \leq 10 seconds per vehicle	Little or no delay. Ave Delay \leq 10 sec/veh	Completely free flow.
"B"	Uncongested operations, all queues clear in a single cycle. Delay > 10 sec/veh and $<$ 20 sec/veh	Short traffic delays. Delay > 10 sec/veh and \leq 15 sec/veh	Free flow, presence of other vehicles noticeable.
"C"	Light congestion, occasional backups on critical approaches. Delay > 20 sec/veh and $<$ 35 sec/veh	Average traffic delays. Delay > 15 sec/veh and \leq 25 sec/veh	Ability to maneuver and select operating speed affected.
"D"	Significant congestions of critical approaches but intersection functional. Cars required to wait through more than one cycle during short peaks. No long queues formed. Delay > 35 sec/veh and $<$ 55 sec/veh	Long traffic delays. Delay > 25 sec/veh and \leq 35 sec/veh	Unstable flow, speeds and ability to maneuver restricted.
"E"	Severe congestion with some long standing queues on critical approaches. Blockage of intersection may occur if traffic signal does not provide for protected turning movements. Traffic queue may block nearby intersection(s) upstream of critical approach(es). Delay > 55 sec and \leq 80 sec/veh	Very long traffic delays, failure, extreme congestion. Delay > 35 sec/veh and \leq 50 sec/veh	At or near capacity, flow quite unstable.
"F"	Total breakdown, stop-and-go operation. Delay > 80 sec/veh	Intersection often blocked by external causes. Delay > 50 sec/veh	Forced flow, breakdown.

Sources: Highway Capacity Manual, 6th Edition

Existing Traffic Conditions

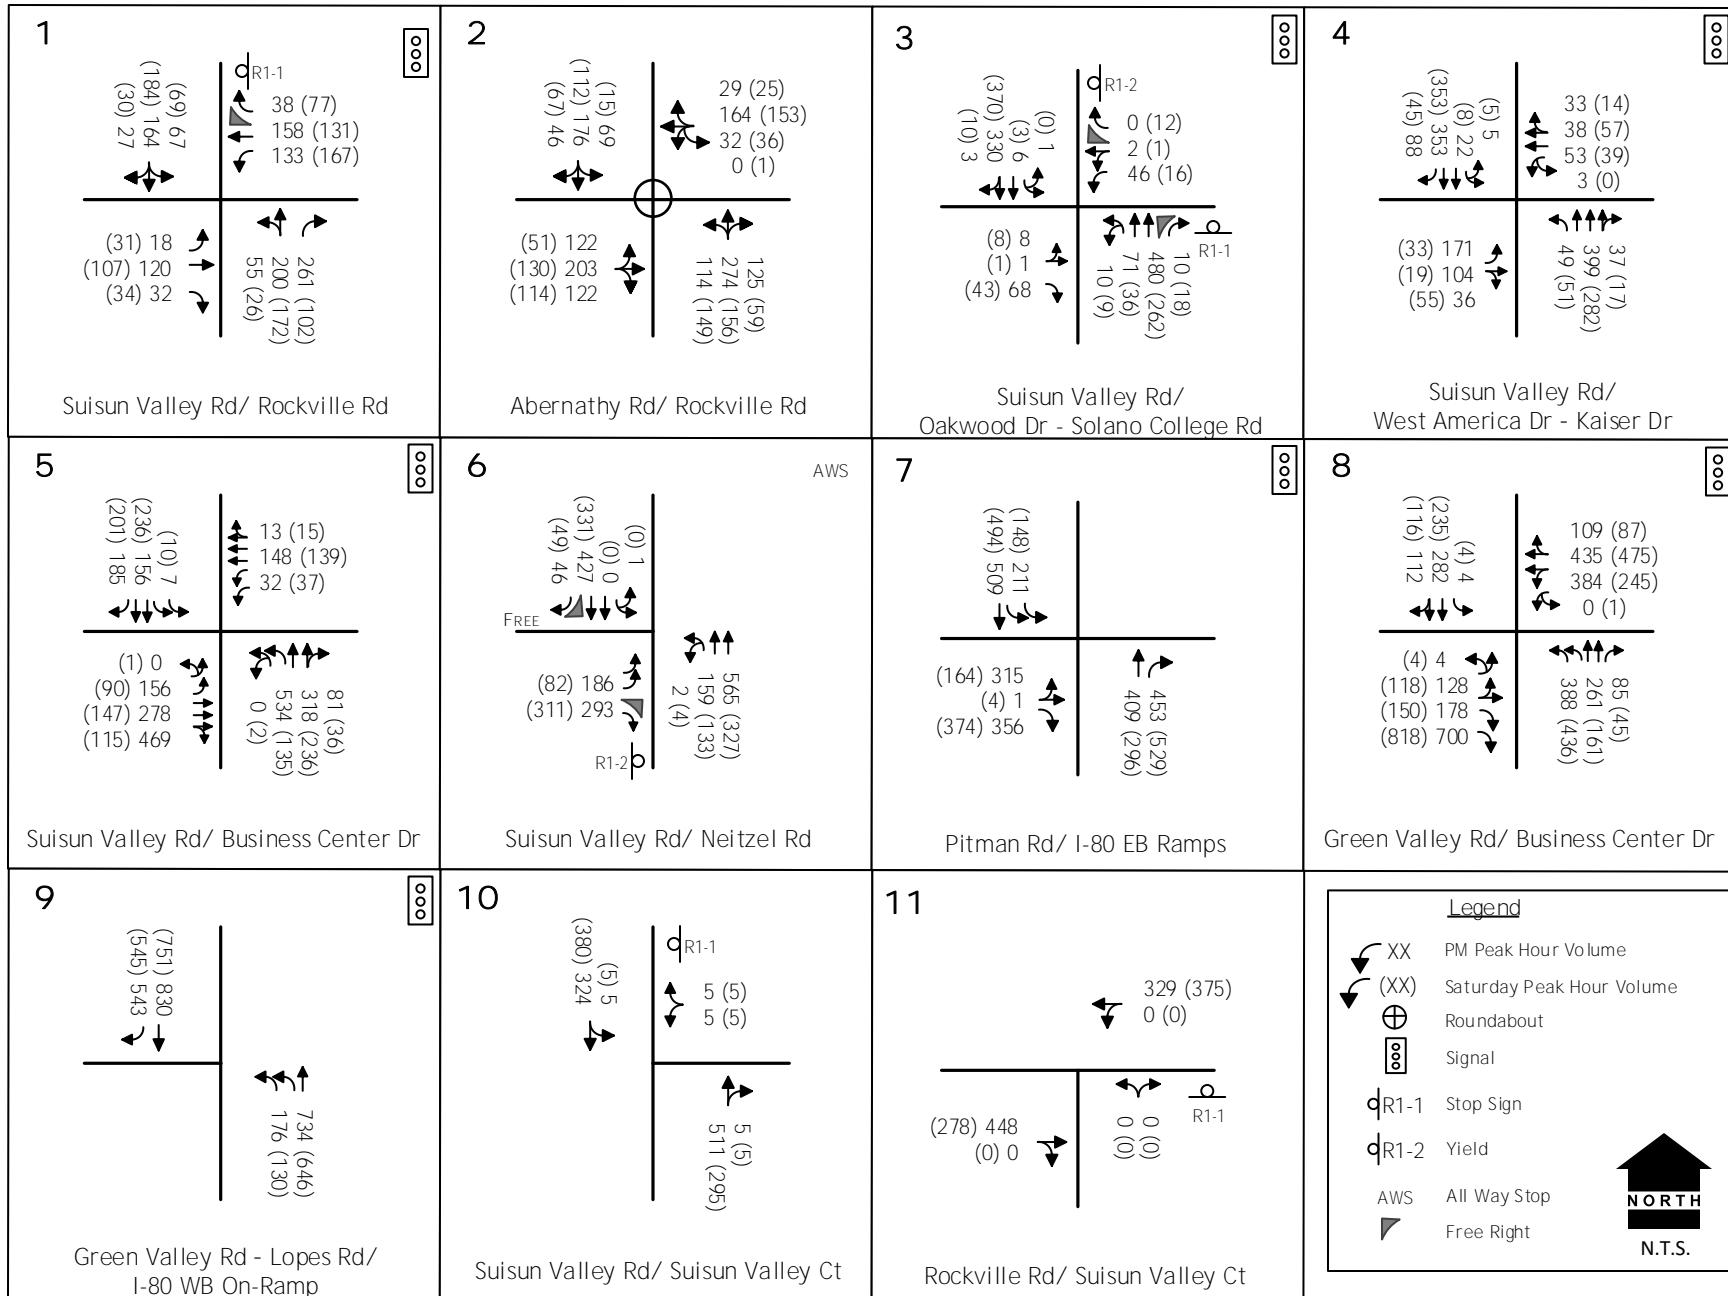

Traffic Volume Counts. Intersection turning movements (ITM) counts were completed during the first week of December 2021. Due to the Covid-19 pandemic, travel patterns had been affected downward due to work and school closures. *StreetLight Data* uses “Big-Data” derived travel pattern analytics against publicly available traffic movement ratios drawn from traffic counts to compare current roadway counts. 2021 ITM’s were compared to 2019 *StreetLight Data* to determine whether current traffic volumes remain significantly lower than pre-Covid conditions. This comparison indicated that current volumes continue to be lower than pre-Covid conditions; therefore, ITM’s were adjusted to 2019 pre-Covid 19 conditions.

Traffic count data from 2021 is included in the Appendix. Figure 3 presents the regional study locations while adjusted ITM’s are presented for each study location in Figure 4.

Intersection Levels of Service. Table 2 summarizes current Levels of Service at the study area intersections during the p.m. and Saturday peak hours. All intersections currently operate within agency LOS thresholds. While the Suisun Valley Road / Neitzell Road intersection operates acceptable the intersection meets the peak hour signal warrant.

Non-Automobile Transportation

Public Transit. Various bus services are provided within Fairfield. These include the Fairfield and Suisun Transit System (FAST) and the SolTrans Intercity routes. These services provide local and intercity routes along the I-80 corridor; in the project vicinity FAST routes #7 and #8 operate in the west Fairfield / Cordelia area and the Blue Line between Sacramento and Walnut Creek while SolTrans operates the R Line between Fairfield and Richmond.

The #7 route operates between the Fairfield Transportation Center and the Cordelia Library with stops along Suisun Valley Road at Solano Community College. The route operates with buses departing the Transportation Center hourly from 6:00 a.m. to 6:00 p.m. Monday through Friday. On Saturdays the route operates from 10:00 a.m. with the last bus departing at 4:00 p.m.

The #8 route operates between the Cordelia Library, the Pitman Road / Central Way area and south Cordelia. The route operates with buses departing the Cordelia Library between 6:30 a.m. and 9:30 a.m., 11:30 a.m. and 2:30 p.m. and 3:30 p.m. and 6:30 p.m. Monday through Friday. On Saturdays the route operates from 10:30 a.m. with the last bus departing at 3:30 p.m.

The Blue Line operates Monday through Friday with 20 northbound stops and 19 southbound stops at the Suisun Valley Road / Westamerica Drive – Kaiser Drive intersection. Stops are made throughout the day with the first southbound stop occurring at 6:11 a.m. and the last northbound stop occurring at 7:44 p.m. All stops provide service to the Walnut Creek BART station and the Vacaville Transportation Center. Saturday service is available at a reduced schedule with six northbound and southbound buses. The buses operate on approximately two-hour headways with the first southbound arrival at 8:05 a.m. and the last northbound arrival at 7:40 p.m.

The Red Line operates Monday through Friday with 16 northbound and southbound stops at the Suisun Valley Road / Westamerica Drive – Kaiser Drive intersection. Stops are made generally at one-hour headways beginning southbound at 6:30 a.m. and at 5:24 a.m. in the northbound direction. The last stops occur at 9:28 p.m. southbound and 8:27 p.m. northbound with all buses servicing the Suisun /Fairfield Amtrak Station and the El Cerrito del Norte BART station. Saturday service is available at a reduced schedule with seven northbound and southbound buses. The buses operate on approximately two-hour headways with the first northbound arrival at 8:25 a.m. and the last southbound arrival at 9:29 p.m.

Bicycle and Pedestrian Facilities. As identified within the *Study Area Intersections* section, sidewalks and bike lanes are present along much of Suisun Valley Road. Along the project frontage there are no sidewalks, nor bike lanes as this area transitions from an urban character within the City of Fairfield to a rural character within Solano County.

EXISTING PLUS PROJECT CONDITIONS

The development of this project will attract traffic to the project site. The amount of additional traffic on a particular section of the street network is dependent upon two factors:

- Trip Generation, the number of new trips generated by the project, and
- Trip Distribution and Assignment, the specific routes that the new traffic takes.

Trip Generation

Trip generation is determined by identifying the type and size of land use being developed. Recognized sources of trip generation data may then be used to calculate the total number of trip ends resulting from the day-to-day operation of the businesses in the project.

The trip generation for this project was developed based on the following uses:

- 6 wine tasting rooms at 1,500 sf
- A 10-room boutique hotel
- A 7,600 sf fine dining restaurant
- A 5,500 sf supermarket
- A 100-person ‘event / multi-use’ center – this would be used for special events at one of the wine tasting rooms. When used, that particular tasting room would close.

Where available, data from the Institute of Transportation Engineers publication, *Trip Generation, 11th Edition*, was used to develop trips. This included the hotel, restaurant and supermarket uses. The wine tasting trip generation was based on the Napa County Winery Trip generation worksheet. For Friday trips it was assumed that a special wine tasting event would occur in the evening; therefore, a special event with outbound traffic assessment was not considered. For the Saturday peak hour it was assumed that 100% of the special event traffic was either inbound or outbound.

As the site has multiple compatible uses, internal trips were considered for the hotel, restaurant and wine tasting facilities while pass-by trips were considered for the supermarket. Table 3 presents the trip generation for the project, with 289 Friday p.m. peak hour trips generated and 384 Saturday trips during a special event. After considering internal trips and pass-by trips the project is expected to generate 211 new Friday p.m. peak hour trips with 146 inbound trips and 65 outbound trips. During the peak hour on Saturday, it is expected that with a special event late in the peak hour period, i.e., special event traffic is headed inbound, 293 new peak hour trips will be generated with 180 inbound trips and 113 outbound trips. For Saturdays where the special event is held early in the peak hour, i.e. special even traffic is leaving, 121 new inbound trips will be generated while 168 outbound trips will occur.

TABLE 3
TRIP GENERATION

EXISTING PLUS PROJECT TRAFFIC VOLUMES AND LANE CONFIGURATIONS

Existing Plus Project Level of Service Impacts

Vehicle Miles Traveled. The project is within an Agriculture Tourist Center District north of I-80. This district allows the uses identified in the *Trip Generation* section of this report. The proposed project includes a variety of uses. These include 6-1,500 square foot wine tasting rooms, a multi-purpose room / event center to accommodate 100 persons for wine tasting event, a 10-room boutique hotel, a 7,600 square foot fine dining restaurant and a 5,500 square foot specialty supermarket.

A review of similar uses in the region shows that there are various wineries north and west of the project location. Additionally, the site includes a supermarket and restaurant which will provide residents with local shopping / dining destinations. Increasing opportunities for these uses closer to the trip origins, users may decrease overall VMT by substituting short trips for longer ones. By having a consolidation of wineries, visitors to the region are likely to visit this location rather than driving between wineries further north and west of the project site. Additionally, the project provides residents with local shopping and dining options who will be able to use more local services. The project will construct a total of 33,000 square foot of buildings.

As noted in the County Interim Modification of Standards a Use Permit or other discretionary development which generates 110 total vehicle trips per day or less (770 total vehicle trips per week or less) will have less than significant impact on VMT. Employee trips are not considered in the total vehicle trip generation due to the reduction in regional commute trips and VMT due to local job creation. Annually, this equates to 40,150 daily trips. The projected number of annual trips the project will generate, excluding those trips that are consistent with the County's VMT policy, are projected to generate 125,435 annual trips. This is a significant impact.

Intersection Levels of Service. Table 5 displays the levels of service for the Friday p.m. peak hour, Saturday peak hour with inbound special event traffic and Saturday peak hour with outbound special event traffic periods. All intersections will operate within the LOS thresholds for each agency. The Suisun Valley Road / Neitzell Road intersection will continue to operate at an acceptable level of service and will continue to meet the peak hour signal warrant. No mitigations are necessary.

CUMULATIVE IMPACTS

The analysis of Cumulative impacts was considered when accommodating the peak tonnage increase for the site.

The analysis of the long range 2040 cumulative condition is intended to consider the impact of this project within the context of buildout of the General Plan circulation element occurring in 2040.

Year 2040 Forecasts / Conditions

2040 Traffic Forecasts

Year 2040 traffic forecasts were based on the most recent Countywide traffic model provided by the Solano Transportation Authority (STA). The method used to develop forecasts of future year peak hour intersection turning movement traffic volumes was based on the increase or decrease of traffic model generated growth factors. Peak hour traffic volumes from the travel model were used to generate growth factors. These growth factors were applied to existing peak hour intersection turning movement traffic volumes. The development of future year intersection turning movement traffic volumes requires that the turning movements at each intersection “balance”. To achieve the balance, inbound traffic volumes must equal the outbound traffic volumes, and the volumes must be distributed among the various left-turn, through, and right-turn movements at each intersection. The “balancing” of future year intersection turning movement traffic volumes was conducted using methods described in the Transportation Research Board’s (TRB’s) National Cooperative Highway Research Program (NCHRP) Report 255, *Highway Traffic Data for Urbanized Area Project Planning and Design*. The NCHRP 255 method applies the desired peak hour directional volumes to the intersection turning movement volumes, using an iterative process to balance and adjust the resulting forecasts to match the desired peak hour directional volumes. Year 2040 forecasted intersection turning movements are presented in Figure 8.

Roadway Conditions

Roadways conditions in the 2040 model are generally projected to remain with their current lane configurations. No changes were noted. Traffic signal timing was optimized where appropriate under the assumption that signal operations do not remain static between Existing and Cumulative conditions.

It is also acknowledged that the I-80 / I-680 / SR 12 interchange is currently being reconstructed with Caltrans the lead agency. This multi-year, multi-phase project will improve connectivity between the two interstate freeways and the state route highway. The project also includes improving access to and from local roadways in Fairfield. Funding for the entire project is not confirmed. The STA model does not appear to include the proposed improvements.

2040 Conditions

Intersection Levels of Service. Table 6 displays the p.m. and Saturday peak hour Levels of Service at each study intersection in the Cumulative 2040 condition. All intersections will operate at acceptable levels of service. The Suisun Valley Road / Neitzell Road intersection will meet the peak hour signal warrant but will continue to operate within acceptable LOS thresholds, at LOS D or better.

2040 Plus Project Level of Service Impacts

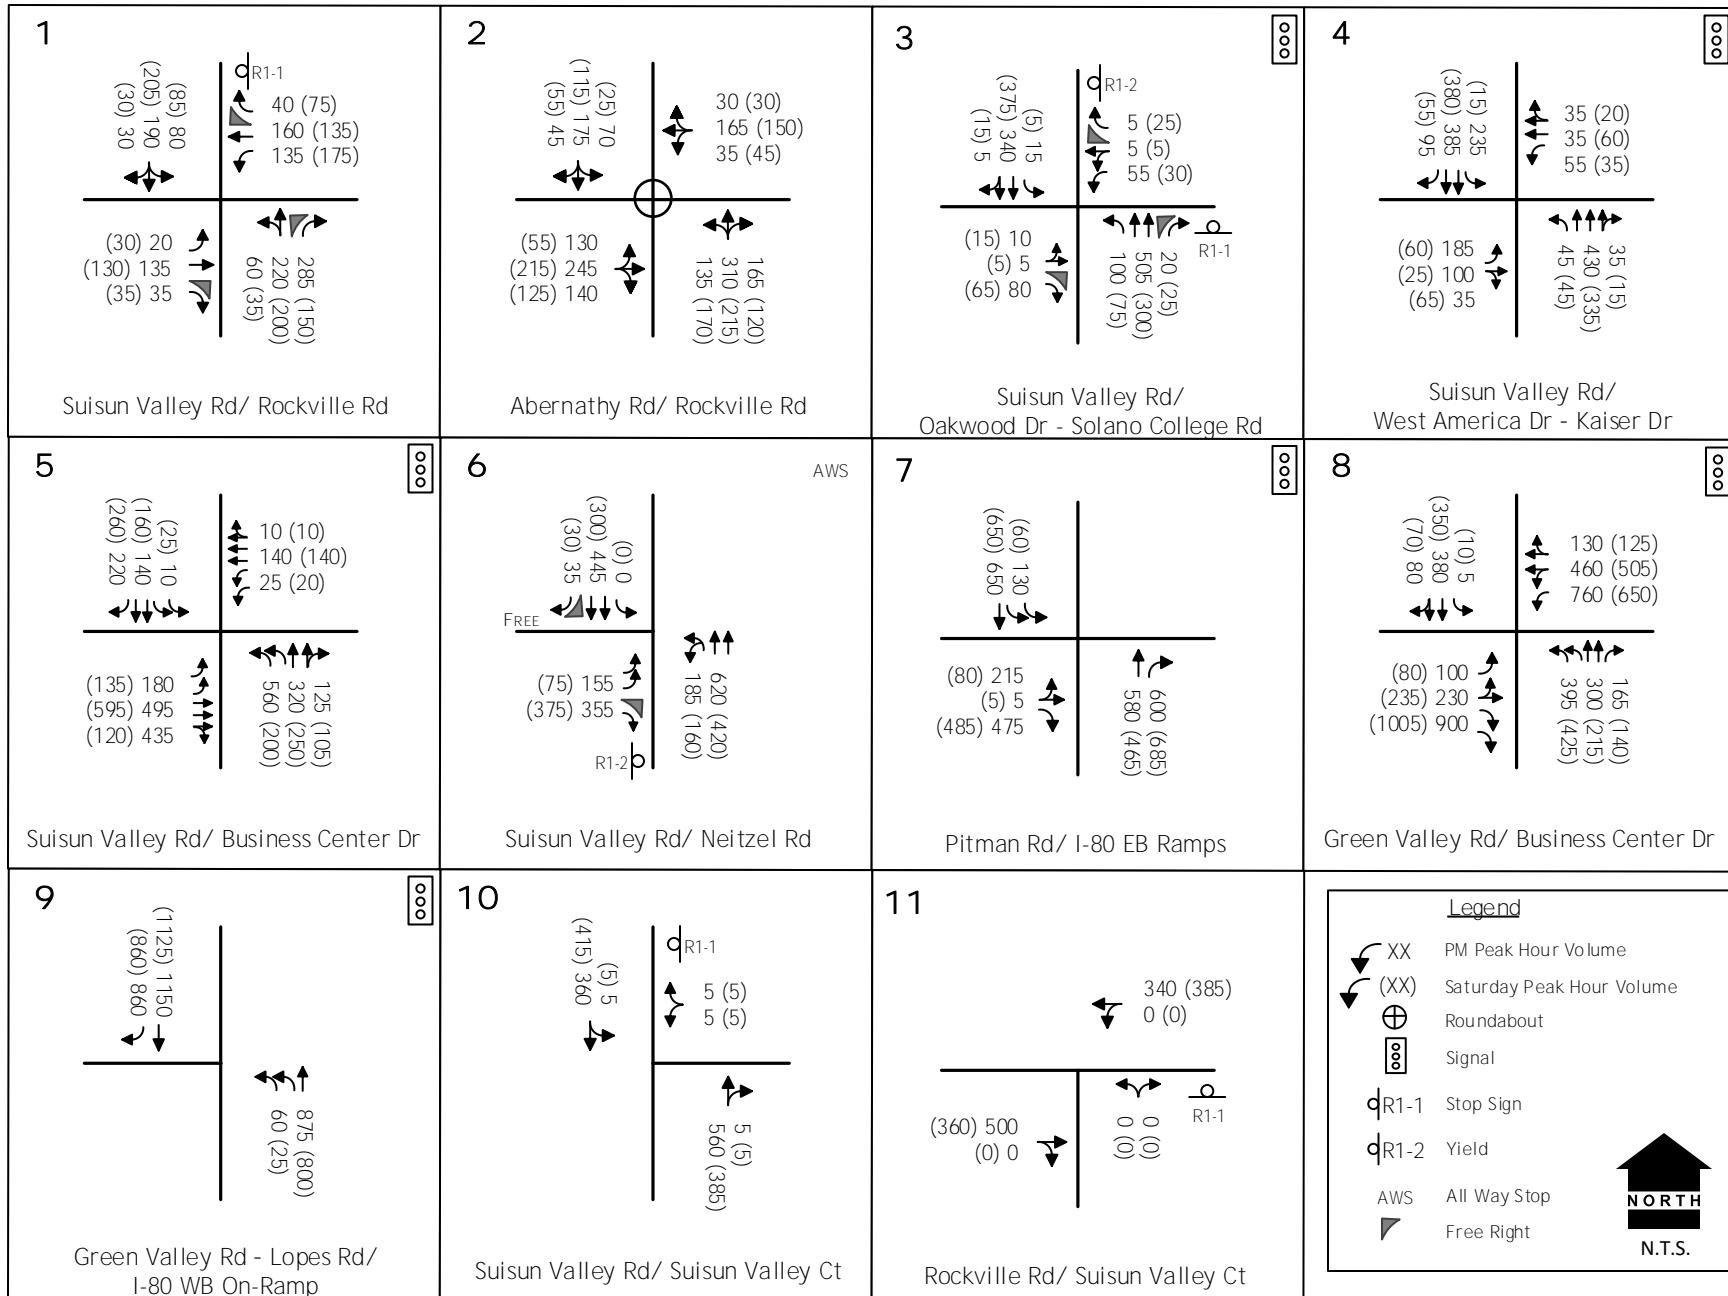

Intersection Levels of Service. Figure 9 presents the projected turning movements at the study intersections under 2040 plus Project conditions. Table 7 displays the Levels of Service at each study intersection in the 2040 plus Project condition for the p.m. peak hour and the Saturday peak hour conditions, considering both inbound and outbound special event traffic. All intersections will operate within the LOS thresholds for each agency. The Suisun Valley Road / Neitzell Road intersection will continue to operate at an acceptable level of service and will continue to meet the peak hour signal warrant. No mitigations are necessary.

PROJECT ACCESS

Two access locations will be provided for the project. One access is the existing Suisun Valley Court intersection along Suisun Valley Road while the second will be along Rockville Road, about 750 feet east of the Suisun Valley Road intersection. Suisun Valley Court will continue to provide access to the existing commercial space in the southeast corner of the Suisun Valley Road / Rockville Road intersection. Several driveways will access the project. The two primary parking areas along the north side of the site will have direct access from the north driveway on Suisun Valley Court and from Rockville Road. A perimeter road will also be provided to provide emergency vehicle access to the south side of the project.

Sight Distance. A sight distance analysis was completed at the proposed project access locations along Suisun Valley Road and Rockville Road.

Available sight distance was evaluated using the standards documented in the Caltrans *Highway Design Manual* (HDM). Based on the location of the driveways “**Minimum Stopping Sight Distance**” (MSSD) and “**Corner Sight Distance**” (CSD) was considered. These criteria are documented in Tables 201.1 and 405.1A of the HDM. As noted in the HDM corner sight distance are not applied to urban driveways unless signalized. However, based on the roadway conditions corner sight distance criteria was also reviewed.

Suisun Valley Road / Suisun Valley Court. The posted speed limit at the project access intersection along Suisun Valley Road is 25 miles per hour (mph); however, just south of the intersection is a speed reduction from 35 mph. It is expected that many motorists will be in the process of reducing the vehicle speed; thus, the 35 mph speed was considered.

The Minimum Stopping Sight Distance (MSSD) is the distance required for an approaching motorist to identify a hazard and come to a stop. The Caltrans Highway Design Manual (HDM) Table 201.1 notes that the minimum sight distance requirement for the posted speed limit of 35 mph is 250 feet. The line of sight from the “driver’s eye” along on Suisun Valley Road is straight and level, and a motorist has a clear view of traffic exiting from Suisun Valley Court.

Corner Sight Distance (CSD) is the distance needed for a motorist to see approaching vehicles and complete a turning maneuver before that vehicle arrives. Table 405.1A notes that CSD is determined based on the design speed of the major road and the time gap needed to complete the maneuver. For a single-unit truck departing the site and turning south, the required time gap is 9½ seconds. With a 35-mph posted speed limit a CSD of about 490 feet is required ($1.47V_mT_g$) to provide adequate time for the vehicle to enter southbound Suisun Valley Road before an opposing vehicle arrives. The sight distance appears adequate.

Rockville Road Driveway. This driveway will form a tee intersection along Rockville Road. Similar to Suisun Valley Road Rockville Road is generally straight and level. The posted speed is 45 mph. The MSSD is 360 feet, and motorists has a clear line of sight along Rockville Road

With a 45-mph posted speed limit a CSD of about 630 feet is required ($1.47V_mT_g$) to provide adequate time for the vehicle to enter westbound Rockville Road before an opposing vehicle arrives. Based on the approximate driveway location the sight distance may be adequate. There appears to be a line of trees along the property frontage on Rockville Road that could interfere with sight distance looking west. It is unknown whether these trees can be removed. There is adequate sight distance looking east. The sight distance should be confirmed during preparation of improvement plans.

Need for Left Turn Lanes

The extent to which project trips create the need for a separate left turn lane at study intersections has been investigated based application of published criteria to long term cumulative volumes

Methodology. The American Association of State Transportation and Highway Officials (AASHTO) has identified guidelines for evaluating the benefits of installing left turn lanes in their publication *A Policy on Geometric Design of Highways and Streets*. AASHTO guidelines take two forms. These guidelines are presented the 11th Edition (2011) in their Exhibit 9-29 and Table 7 and base the need for a left turn lane on the volume of approaching and opposing traffic on the mainline road and the relative percentage of that traffic that turns. These criteria are applicable to intersections where the major street traffic proceeds freely and side street traffic is controlled by stop signs. This methodology considers high speed roadways of 40 mph or greater.

The AASHTO publication was updated in December 2018 and different guidelines are now available. The newer guidelines suggest that a left turn lane could be beneficial based on the volume of traffic turning and the total volume per lane on the road. The new guidance considered rural and urban conditions. This guidance is presented in their Figures 9-35 and 9-36 (Table 8) which follows. These guidelines also suggest volume thresholds for creation of a “bypass” lane that, absent a full turn lane, would allow through traffic to proceed around a vehicle stopped to turn left at a “tee” intersection. The information supporting the 2018 guidelines notes, however, that “*The volume based guidelines or warrants presented below indicate situations where a left turn lane may be desirable, not necessarily situations where a left-turn lane is definitely needed*”.

TABLE 7
TRAFFIC VOLUMES JUSTIFYING LEFT TURN LANES
UNDER 2011 AASHTO

Opposing Volume (veh/hr)	Advancing Volume (veh/hr)			
	5% Left Turns	10% Left Turns	20% Left Turns	30% Left Turns

* Approach volume
Urban areas / Rural area

Assessment. The justification of a for left turn lane was considered at two locations, as noted in Table 9. The need for left turn lanes was considered based on factors such as the frequency of volumes reaching warrants levels, the availability of adequate sight distance and the nature of motorists attracted to the site.

Suisun Valley Road / Suisun Court. As previously determined sight distance is adequate at this intersection. A left turn lane could be justified based on the 2011 AASHTO criteria as the Friday p.m. volumes meet the minimum requirements; however, the method is based on a 40-mph speed, the lowest speed considered. For both Saturday alternatives the left turn lane is not justified. The 2018 methodology shows that a left turn lane could be justified for each of the study periods. While many motorists may not be familiar with the project location those left turning visitors will have just passed through a signalized intersections 250 feet to the north and are traveling through a 25-mph speed zone. A review of crash data from the California Highway Patrol SWITRS database between 2017 and 2019 showed few crashes along Suisun Valley Road in the project vicinity. Of the crashes noted they were generally due to speeding, DUI, improper turns leading to the hitting of an object and one improper starting / backing occurring north of Rockville Road.

As noted in the AASHTO manual the volume-based guidelines indicate situations where a left turn lane may be desirable, not necessarily situations where a left-turn lane is definitely needed. It is recommended that the speed zone along Suisun Valley Road south of Rockville Road be extended south to provide a longer 25-mph speed zone leading to the Rockville Road intersection.

Rockville Road / Project Driveway. It was previously identified that the sight distance at this location should be verified looking west as the location of the driveway relative to the existing tree line is undetermined. The projected volumes at this location will not satisfy the 2011 AASHTO criteria but will satisfy the 2018 methodology. A review of crash data from the California Highway Patrol SWITRS database between 2017 and 2019 showed few crashes along Rockville Road in the project vicinity. Of the crashes noted they were generally due to speeding and improper turns leading to the hitting of an object.

As noted in the AASHTO manual the volume-based guidelines indicate situations where a left turn lane may be desirable, not necessarily situations where a left-turn lane is definitely needed. It is recommended that the speed zone along Rockville Road east of Suisun Valley Road be extended east to provide a longer 25-mph speed zone leading into the project area and the Suisun Valley Road / Rockville Road intersection. The extension of the 25-mph speed zone will also reduce the needed sight distance to about 350 feet.

TABLE 9
SUMMARY OF LEFT TURN LANE ASSESSMENT
CUMULATIVE PLUS PROJECT CONDITIONS

Location	AASHTO 2011 Methodology					AASHTO 2018 Methodology		
	Friday Peak Hr Left Turn Volume	Major Street Traffic Volume		Percent Left Turns	Design Speed	Left Turn Lane Justified?	Major Street Volume Per lane

Site Access on Rockville Road	20	403	364	5.0%	45 mph	No	364	Yes

* 40 mph lowest operating speed; meets criteria for 40 mph

FINDINGS / RECOMMENDATIONS/ IMPROVEMENTS

The preceding analysis has identified project impacts that may occur without identifying any recommendations or improvements. The text that follows identifies a strategy for recommendations to the ‘No Project’ conditions or improvements to the ‘Plus Project’ conditions.

Existing Conditions

Recommendations. All intersections currently operate within agency thresholds, within LOS C conditions at Solano County intersections and LOS D conditions at City of Fairfield and Caltrans agency intersections. While operating at an acceptable level of service the Suisun Valley Road / Neitzell Road intersection meet the peak hour signal warrant.

Significant Transportation Effects for Existing plus Project Conditions

The project’s VMT will exceed the County’s VMT policy. The California Air Pollution Control Officers Association (CAPCOA) *Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity* publication provides alternative measures to reduce VMT and greenhouse gases. To reduce the project VMT the following CAPCOA trip reduction measures should be considered:

T-5 Implement Commute Trip Reduction Program – Voluntary

This strategy would implement a voluntary Commute Trip Reduction (CTR) program with employers to discourage single-occupancy vehicle trips and encourage alternative modes of transportation such as carpooling, taking transit, walking, and biking. Using the Greenhouse Gas Reduction Formula shown in the appendix the maximum GHG reduction is 4%. The applicant should consider working with *Solano Mobility* to develop trip reduction strategy.

T-7 Implement Commute Trip Reduction (CTR) Marketing

This measure would implement a marketing strategy to promote the project site employer’s CTR program. Information sharing and marketing promote and educate employees about their travel choices to the employment location beyond driving such as carpooling, taking transit, walking, and biking, thereby reducing VMT and GHG emissions. Using the Greenhouse Gas Reduction Formula shown in the appendix the maximum GHG reduction is 4%.

T-9 Implement Subsidized or Discounted Transit Program

This measure would provide subsidized or discounted, or free transit passes for employees and/or residents. Reducing the out-of-pocket cost for choosing transit improves the competitiveness of transit against driving, increasing the total number of transit trips and decreasing vehicle trips. This decrease in vehicle trips results in reduced VMT and thus a reduction in GHG emissions. The closest route to the project is the City of Fairfield FAST Route #7 which operates between the Fairfield Transportation Center and the Cordelia Library with a stop at Solano Community College. This stop is less than $\frac{1}{2}$ mile from the project site.

T-10 Provide End of Trip Facilities

This measure will install and maintain end-of-trip facilities for employee use. End-of-trip facilities include bike parking, bike lockers, showers, and personal lockers. The provision and maintenance of secure bike parking and related facilities encourages commuting by bicycle, thereby reducing VMT and GHG emissions. Using the Greenhouse Gas Reduction Formula shown in the appendix the maximum GHG reduction is 4.4%.

T-14 Provide Electric Vehicle Charging Infrastructure

Install onsite electric vehicle chargers in an amount beyond what is required by the 2019 California Green Building Standards (CALGreen) at buildings with designated parking areas (e.g., commercial, educational, retail, multifamily). This will enable drivers of Plug-In Hybrid Electric Vehicles (PHEVs) to drive a larger share of miles in electric mode (eVMT), as opposed to gasoline-powered mode, thereby displacing GHG emissions from gasoline consumption with a lesser amount of indirect emissions from electricity. Most PHEVs owners charge their vehicles at home overnight. When making trips during the day, the vehicle will switch to gasoline mode if/when it reaches its maximum all-electric range. The maximum GHG reduction is 11.9%.

T-18 Provide Pedestrian Network Improvement

This measure will increase the sidewalk coverage to improve pedestrian access. Providing sidewalks and an enhanced pedestrian network encourages people to walk instead of drive. This mode shift results in a reduction in VMT and GHG emissions. The installation of sidewalk along the Suisun Valley Road frontage will provide for a future connection to Solano Community College.

T-22 Implement Pedal Bikeshare Program (Non-Electric and/or Electric)

This measure will establish a bikeshare program. Bikeshare programs provide users with on-demand access to bikes for short-term use. This encourages a mode shift from vehicles to bicycles, displacing VMT and thus reducing GHG emissions. This program could be useful for visitors to the site exploring the Solano Wine Region along Suisun Valley Road. The maximum GHG reduction is 0.06%.

T-25 Extend Transit Network Coverage or Hours

This measure will expand the local transit network by either adding or modifying existing transit service or extending the operation hours to enhance the service near the project site. Starting services earlier in the morning and/or extending services to late-night hours can accommodate the commuting times of alternative-shift workers. This will encourage the use of transit and therefore reduce VMT and associated GHG emissions. This measure could extend Route 7 of the FAST network to the Suisun Valley Road / Rockville Road intersection to further encourage transit ridership.

Under Existing plus Project conditions, all intersections will continue to operate within acceptable levels of service. The Suisun Valley Road / Neitzell Road intersection will continue to operate at an acceptable level of service and meet the peak hour signal warrant.

The following recommendations are noted:

- The project should pay their fair share traffic impact fees in Solano County.
- The County should consider extending the 25-mph speed zone along Rockville Road to east of the project driveway as the site will be within the Rockville community. Shifting the zone to at least 150 feet east of the driveway will provide westbound motorists time to decelerate from 45 mph to 25 mph prior to reaching the driveway.
- The County should consider extending the 25-mph speed zone along Suisun Valley Road at least 100 feet south of the existing speed limit sign location. This will provide northbound motorists time to decelerate to 25-mph prior to reaching the intersection.

2040 Conditions

Under 2040 conditions all intersections are projected to operate within agency thresholds, within LOS C conditions at Solano County intersections and LOS D conditions at City of Fairfield and Caltrans agency intersections. The Suisun Valley Road / Neitzell Road intersection will operate at LOS D or better and meet the peak hour signal warrant.

Significant Transportation Effects for 2040 Plus Project Conditions

Under 2040 plus Project conditions, all intersections will continue to operate within acceptable levels of service. The Suisun Valley Road / Neitzell Road intersection will continue to operate at an acceptable level of service and meet the peak hour signal warrant.

The diagram illustrates the mapping of time zones. It shows three vertical columns representing time zones. The left column has arrows pointing upwards from 'AM' at the top to 'NOON' in the middle, and from 'NOON' to 'PM' at the bottom. The middle column has arrows pointing downwards from 'AM' at the top to 'NOON' in the middle, and from 'NOON' to 'PM' at the bottom. The right column has arrows pointing upwards from 'AM' at the top to 'NOON' in the middle, and from 'NOON' to 'PM' at the bottom. The labels 'AM', 'NOON', and 'PM' are repeated at the top and bottom of each column.

A diagram showing a four-way stop sign at a junction. Arrows indicate traffic flow from all four directions. The top arrow points down, the left arrow points right, the bottom arrow points up, and the right arrow points left. The sign is yellow with black text.

SOUTHBOUND

AM	0	0	0	0	AM	
NOON	0	0	0	0	NOON	
PM	116	235	4	0	366	PM
						

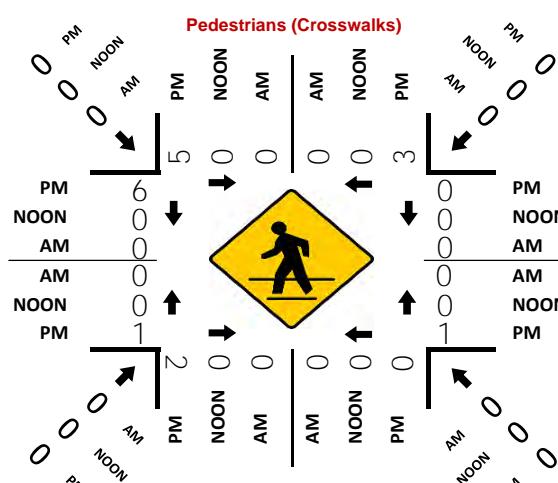

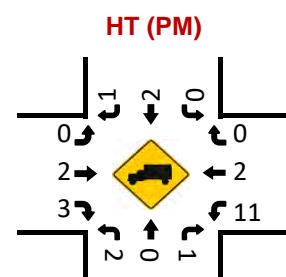

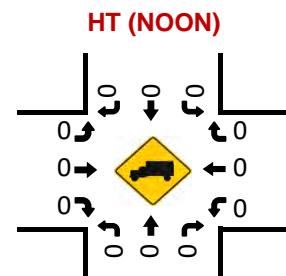

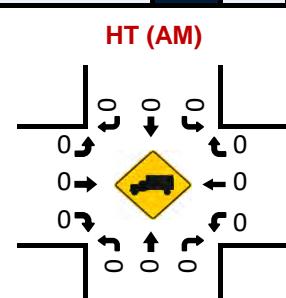

The application interface features a central 'CONTROL' box with a dark blue header. Below it, a white section displays the word 'Signalized'. The main body contains four data rows:

TEV	0 AM	0 NOON	2895 PM 0.97
PHF			

Surrounding the central box are various control elements: a large double-headed arrow on the left, a double-headed arrow pointing up on the top right, and several smaller arrows (up, down, left, right) and numerical values (0) positioned along the perimeter.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Signalised Intersections.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

Delay Model: HCM Delay Formula (Geometric Delay is not included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Signalised Intersections.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

Delay Model: HCM Delay Formula (Geometric Delay is not included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Signalised Intersections.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

Delay Model: HCM Delay Formula (Geometric Delay is not included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Signalled Intersections.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

Delay Model: HCM Delay Formula (Geometric Delay is not included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Signalled Intersections.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

Delay Model: HCM Delay Formula (Geometric Delay is not included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Intersection Summary

HCM 6th Ctrl Delay	12.5
HCM 6th LOS	B

Notes

User approved volume balancing among the lanes for turning movement.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Unsignalized Delay for [NBR, WBR] is excluded from calculations of the approach delay and intersection delay.

Intersection Summary

HCM 6th Ctrl Delay	47.8
HCM 6th LOS	D

Notes

User approved pedestrian interval to be less than phase max green.

User approved volume balancing among the lanes for turning movement.

User approved ignoring U-Turning movement.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Signalised Intersections.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if $v/c > 1$ irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

Delay Model: HCM Delay Formula (Geometric Delay is not included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Intersection Summary

HCM 6th Ctrl Delay	11.0
HCM 6th LOS	B

Notes

User approved volume balancing among the lanes for turning movement.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Unsignalized Delay for [NBR, WBR] is excluded from calculations of the approach delay and intersection delay.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Signalised Intersections.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

Delay Model: HCM Delay Formula (Geometric Delay is not included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Intersection Summary

HCM 6th Ctrl Delay	12.6
HCM 6th LOS	B

Notes

User approved volume balancing among the lanes for turning movement.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Unsignalized Delay for [NBR, WBR] is excluded from calculations of the approach delay and intersection delay.

Intersection Summary

HCM 6th Ctrl Delay	49.1
HCM 6th LOS	D

Notes

User approved pedestrian interval to be less than phase max green.

User approved volume balancing among the lanes for turning movement.

User approved ignoring U-Turning movement.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Signalised Intersections.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

Delay Model: HCM Delay Formula (Geometric Delay is not included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Signalled Intersections.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

Delay Model: HCM Delay Formula (Geometric Delay is not included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Signalled Intersections.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

Delay Model: HCM Delay Formula (Geometric Delay is not included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Winery Traffic Information / Trip Generation Sheet

Traffic during a Typical Weekday

Number of FT employees:	<u>1</u>	x 3.05 one-way trips per employee	=	<u>3</u>	daily trips.
Number of PT employees:	<u>3</u>	x 1.90 one-way trips per employee	=	<u>6</u>	daily trips.
Average number of weekday visitors:	<u>60</u>	/ 2.6 visitors per vehicle x 2 one-way trips	=	<u>46</u>	daily trips.
Gallons of production:	<u>1</u>	/ 1,000 x .009 truck trips daily ³ x 2 one-way trips	=	<u>—</u>	daily trips.
			Total =	<u>55</u>	daily trips.
			Number of total weekday trips x .38 =	<u>21</u>	PM peak trips. per tasting room

Traffic during a Typical Saturday

Number of FT employees (on Saturdays):	<u>1</u>	x 3.05 one-way trips per employee	=	<u>3</u>	daily trips.
Number of PT employees (on Saturdays):	<u>3</u>	x 1.90 one-way trips per employee	=	<u>6</u>	daily trips.
Average number of weekend visitors:	<u>80</u>	/ 2.8 visitors per vehicle x 2 one-way trips	=	<u>57</u>	daily trips.
			Total =	<u>66</u>	daily trips.
			Number of total Saturday trips x .57 =	<u>38</u>	PM peak trips. per tasting room

Traffic during a Crush Saturday

Number of FT employees (during crush):		x 3.05 one-way trips per employee	=		daily trips.
Number of PT employees (during crush):		x 1.90 one-way trips per employee	=		daily trips.
Average number of weekend visitors:		/ 2.8 visitors per vehicle x 2 one-way trips	=		daily trips.
Gallons of production:		/ 1,000 x .009 truck trips daily x 2 one-way trips	=		daily trips.
Avg. annual tons of grape on-haul:		x .11 truck trips daily ⁴ x 2 one-way trips	=		daily trips.
			Total =		daily trips.
			Number of total Saturday trips x .57 =		PM peak trips.

SATURDAY - USE OF MULTI PURPOSE Room FOR WINE EVENT Largest Marketing Event- Additional Traffic

Number of event staff (largest event):	<u>8</u>	x 2 one-way trips per staff person	=	<u>16</u>	trips.
Number of visitors (largest event):	<u>100</u>	/ 2.8 visitors per vehicle x 2 one-way trips	=	<u>72</u>	trips.
Number of special event truck trips (largest event):		x 2 one-way trips	=	<u>88</u>	trips.
					for multi purpose room (round trip)

³ Assumes 1.47 materials & supplies trips + 0.8 case goods trips per 1,000 gallons of production / 250 days per year (see Traffic Information Sheet Addendum for reference).

⁴ Assumes 4 tons per trip / 36 crush days per year (see Traffic Information Sheet Addendum for reference).
